Common rail diesel (CRD) engines, like all diesel engines, are known for their prodigious torque delivery. When CRD power declines, root causes are frequently overlooked until later in the diagnosis. Common rail diesel (CRD) systems operate in a world of extremes, with almost unimaginable capabilities. For example, during its service life, a typical fuel injector on a commercial vehicle will open and close more than a billion times, and the pressure in the fuel injection chamber can be as ...

Common Rail Diesel Performance Problems | MOTOR

In this system the fuel is distributed to the injector from a high pressure accumulator and through a rail and this rail is common to all the cylinder, because of this only it is called as common rail injection system. The quantity of the fuel and atomization are controlled electronically using a programmable control module.

The common-rail version of the ISB Cummins all but reinvented the 5.9L. To be sure, it was still an all-iron, 359 ci inline-six sporting a 24-valve head, but the legendary oil-burner powering Dodge's 03 heavy-duty trucks went from having a few electronic controls to being completely reliant on them in order to operate.

Common rail injection is a completely revolutionary design to fuel injection since a fuel pump is now used to pressurize a rail and then from there sends the fuel to each injector. A major benefit of switching over to this fueling system was how it allowed for much less leakage into the cylinders pre and post ignition.

The Common Rail system is an electronically controlled direct fuel injection system for diesel engines. The common-rail pressure ranges from 30 to 160 MPa for the 1KD-FTV engine. The fuel is injected into the cylinders by the eight-hole type injectors. The air for 3.0 D-4D engine is supplied by a variable geometry turbocharger Toyota CT16V.

It's the high-pressure fuel rail and the computer controlled electronic injectors that make all the difference. In the common rail system, the fuel pump charges the fuel rail at a pressure of up to 25,000 psi. But unlike indirect injection pumps, it is not involved in fuel discharge. Under the control of the onboard computer, this fuel quantity and pressure accumulates in the rail independently of engine speed
