A Guide to Qualitative Meta-synthesis provides accessible guidelines for conducting all phases of theory-generating meta-synthesis research, including data collection, analysis, and theory generation. It is a research methodology that is designed to generate evidence-based theory by extracting, analyzing, and synthesizing qualitative findings from across published investigations. These theories provide scaffolding that can be used by health-care providers and other professionals to make context-based decisions and implement situation-specific actions. Theory-generating meta-synthesis methods stem from the qualitative research paradigm, especially grounded theory. Systematic and rigorous methods are used to identify topically related research reports that provide qualitative findings for analysis. The subsequent analysis of the data goes beyond merely reorganizing and

recategorizing research findings. Newly synthesized concepts are developed, and the dynamic relationships among them are fully articulated. The validity of the resultant theory is ensured based on theoretical, methodological, and researcher triangulation; unbiased data collection and sampling strategies; inductive-deductive data analysis and synthesis strategies; and continuous reflexivity. Meta-synthesis-generated theories are highly important in environments where the use of normalized algorithms, guidelines, and protocols are on the rise. The types of theories discussed in this book will help service providers customize standardized tools so that the most effective evidence-based, yet individualized, interventions can be implemented.

Displaying multiple levels of data visually has been proposed to address the challenge of limited screen space. Although many previous empirical studies have addressed different aspects of this question, the information visualization research community does not currently have a clearly articulated consensus on how, when, or even if displaying data at multiple levels is effective. To shed more light on this complex topic, we conducted a systematic review of 22 existing multi-level interface studies to extract high-level design guidelines. To facilitate discussion, we cast our analysis findings into a four-point decision tree: (1) When are multi-level displays useful? (2) What should the higher visual levels display? (3) Should the different visual levels be displayed simultaneously, or one at a time? (4) Should the visual levels be embedded in a single display, or separated into multiple displays? Our analysis resulted in three design guidelines: (1) the number of levels in display and data should match;

(2) high visual levels should only display task-relevant information;
(3) simultaneous display, rather than temporal switching, is suitable for tasks with multi-level answers.
